BIM Pipeline Stands Out

With day two of IBS (Intl. Builders Show) in full swing in Las Vegas, many of the technology solutions continue to stand out on the show floor. One product continues to garner the attention of builders for its unique ability to improve workflow.

CG Visions', www.cgvisions.com, Lafayette, Ind., BIM Pipeline is a game changer when it comes to Web-based, rules-driven materials management and estimation, as it uses BIM (building information modeling) data to directly drive detailed takeoffs.

For builders, this means leveraging data to create full master plan estimates with delta BOM (bill of materials) reports for options and lot customizations.

In the past year, the company has continued to expand the core product's functionality with new features including supplemental to bid items, early model/option and job-cost analysis, community standard costs, and community standard option costs, as a few examples.

The product also generated a lot of interest among homebuilders in the past year, as the number of customers nearly doubled. The bottomline is the product is not only unique, but also offers an easy way to evolve business and improve workflow.

The product provides a way to improve materials management and estimation, which is simply one of the reasons it recently won the 2016 *Constructech* Top Products award, which highlights achievements and advancements in technology that have had a significant impact on the homebuilding market.

BIM Pipeline proves BIM can be a game changer in residential construction, as the technology provider continues to innovate and discover new ways to make processes easier for homebuilders.
